Introduction

Our project is about a Hospital Management System (HMS). It also improves the management visibility of hospitals, all information, and data regarding the patient, doctor and medicine could be seen by any department easily. A hospital stores extensive amounts of patient data for easy accessibility. The databases behind this collection of information are massive, with complex data structures and security protecting sensitive data. By using this management system we can save much of our time. It makes finding data easier than using pen and paper. By using our hospital management system we can find the data very easily and save plenty of time.

List Of Tables

- I. DEPARTMENT
- II. DOCTORS
- III. DOCTORS_INFO
- IV. PATIENTS
- V. CHECK_UP
- VI. PATIENT_ADMIT
- VII. PATIENT_DISCHARGE
- VIII. RAGULAR_PATIENT
- IX. PRS_MEDICINE

Normalization

→ First Normal Form (1NF)

For a table to be in the First Normal Form, it should follow the following 4 rules:

- It should only have single(atomic) valued attributes/columns.
- Values stored in a column should be of the same domain
- All the columns in a table should have unique names.
- The order in which data is stored, does not matter.

In our project by default, we follow the 1st law of 1st normalization.

In the PATIENT_DISCHARGED table we follow the 2nd law of 1st normalization. First, we determine the value of the MEDICINE column with the value of the PAYMENT column. Later we fix it and put in their respective columns. This table we also follow the 3rd law of 1st normalization. This table has TR_ADVISE, TR_GIVEN columns. But when we create tables, we assign TR_ADVS columns twice to the table. Then we solve these problems and we define the TR_ADVISE and TR_GIVEN columns.

At last, we follow the 4th law of 1st normalization. When we assign VALUES in columns, sometimes we assign it to the sequence and sometimes we assign the VALUES randomly.

→ Second Normal Form (2NF)

For a table to be in the Second Normal Form:

- It should be in the First Normal form.
- It should not have Partial Dependency.

DOCTORS table following the 1st normalization from.

The DOCTORS table contains the columns like DR_ID, DR_NAME, QUALIFICATION, DEPARTMENT, JOIN_DATE, SALARY, PHONE_NO, EMAIL_ADDRESS. Here we see partial dependency and we solve this problem. Following the 2nd law, we have divided the DOCTORS table into DOCTORS (DR_ID, DR_NAME, QUALIFICATION, DEPARTMENT) and DOCTORS_INFO (JOIN_DATE, SALARY, EMAIL_ADDRESS, PHONE_NO) tables.

→ Third Normal Form (3NF)

A table is said to be in the Third Normal Form when,

- It is in the Second Normal form.
- It doesn't have Transitive Dependency.

We did not find any specific place to apply this law in our project.

Case Study

In a hospital, there are many departments. Each department has a unique department Id, name, location, and facilities. Many doctors work for the hospital and the departments they are associated with. Each doctor has a name, qualification, email address, phone number, identity number, salary, date of joining. Doctors are referred to by their doctor id number. When any patient arrives in the hospital for a check-up. A patient ID number is generated and name, age, sex, address, phone number, diagnosis is also stored. After storing the necessary details, the patient is sent to the doctor for check-up. There are two types of patients in the hospital. Some regular patients and some new patients are coming for admission. When regular patients are coming to the hospital some formalities need to be filled out like payment, visiting date. After the check-up, the doctor prescribes the medicine. When a patient is admitted, details are stored. Information stored includes patient number, advance payment, mode of payment, room number, condition. After the treatment is completed, the doctor discharges the patient. Whenever a patient is discharged from the hospital, some formalities must be completed like payment made, treatment given, treatment advice, date of discharge.

Query

Simple :

1) Display all the records in the department table?

```
select * from DEPARTMENT
```

$$\sigma_*(DEPARTMENT)$$

2) Display doctors_id ,doctors_name,dept_id , qualification in Doctors table?

```
select DOCTORS_ID,DOCTORS_NAME, DEPT_ID, QUALIFICATIONS from DOCTORS
```

$$\sigma_{DOCTORS_ID,DOCTORS_NAME,DEPT_ID,QUALIFICATIONS}(doctors)$$

3)Display all the records in the admit_patient table?

```
select * from patient_admit
```

$$\sigma_*(patient_admit)$$

4)Display all the records in the PATIENT_DISCHARGE table?

```
select * from PATIENT_DISCHARGE
```

$\sigma_*(patient_discharge)$

5) Display patients_name ,patients_id in the patients table?

```
select patients_name, patients_id from PATIENTS
```

$\sigma_{patients_name, patients_id}(patients)$

6) Display doctors_id, salary in doctors_info?

```
select doctors_id, salary from DOCTORS_INFO
```

$\sigma_{doctors_id, salary}(doctors_info)$

7) Display patient_name , patients_id in regular_patient table?

```
Select patient_name, patients_id from regular_patient
```

$\sigma_{patients_name, patients_id}(regular_patient)$

Complex :

8) Display patients_name in the patients table where the second letter of patient_name is 'A'?

```
select patients_name from patients where patients_name like '_A%'
```

$\Pi_{patients_name}(\sigma_{patients_name \text{ like } '_A\%'}(Patients))$

9) Display patients_name in the patients table where the last letter of patient_name is 'A'?

```
select patients_name from patients where patients_name like '%A'
```

$\Pi_{patients_name}(\sigma_{patients_name \text{ like } '\%A'}(Patients))$

10) Display all doctors who join before 21/01/2019?

```
select * from DOCTORS_INFO where JOIN_DATE<='21/01/2019'
```

$$\Pi_{*} (\sigma_{JOIN_DATE \leq '21/01/2019'} (doctors_info))$$

Sub-Query:

11) Display all the doctors_name in the doctors table where salary is greater than avg salary?

```
select DOCTORS_NAME from DOCTORS where DOCTORS_ID in(select DOCTORS_ID  
from DOCTORS_INFO where SALARY>(select avg(SALARY) from DOCTORS_INFO))
```

$$\Pi_{doctors_name} (\sigma_{doctors_id \in (\Pi_{doctors_id} (\sigma_{salary > (\sigma_{avg(SALARY)} (doctors_info)) (doctors_info))} (doctors))$$

12) Display all the doctors_name in the doctors table where JOIN_DATE before or Equal '21/01/2019'?

```
Select DOCTORS_NAME from DOCTORS where DOCTORS_ID not in (select  
DOCTORS_ID from DOCTORS_INFO where JOIN_DATE<='21/01/2019')
```

$$\Pi_{doctors_name} (\sigma_{doctor_id \text{ not in } (\Pi_{doctor_id} (\sigma_{doctor_id > JOIN_DATE \leq '21/01/2019'} (doctors_info)))} (doctors))$$

Function:

13) Count how many patients_id in patients_table?

```
select count (patients_id) from patients
```

$$\sigma_{count (patients_id)} (Patients)$$

14) Display a round of average salary in the doctors_info table?

```
select avg(round (SALARY)) from DOCTORS_INFO
```

$$\sigma_{avg(round (SALARY))} (Patients)$$

15) Display sumision of payment in patient_Discharge table?

```
select sum (PAYMENT) from PATIENT_DISCHARGE
```

$$\sigma_{\text{sum (PAYMENT)}}(\text{Patients})$$

Joining:

16) Display all the REGULAR_PATIENT who are in the PRS_MEDICINE table?

```
SELECT * FROM PRS_MEDICINE JOIN REGULAR_PATIENT ON  
PRS_MEDICINE.PATIENTS_ID= REGULAR_PATIENT.PATIENTS_ID
```

$$\Pi_* (\sigma_{\text{PRS_MEDICINE.PATIENTS_ID= REGULAR_PATIENT.PATIENTS_ID}} (\text{PRS_MEDICINE} \bowtie \text{REGULAR_PATIENT}))$$

17) Display all the doctors_id that are in Doctors and doctors_Info TABLE?

```
SELECT * FROM DOCTORS  
JOIN DOCTORS_INFO ON DOCTORS.DOCTORS_ID= DOCTORS_INFO.DOCTORS_ID
```

$$\Pi_* (\sigma_{\text{DOCTORS.DOCTORS_ID= DOCTORS_INFO.DOCTORS_ID}} (\text{DOCTORS} \bowtie \text{DOCTORS_INFO}))$$

Views:

18) Create a view called doctors_bio based on the doctors_name, qualifications, department name Where doctors_id are 202 and 205.

```
create view doctors_bio as select doctors_name, qualifications,  
DEPARTMENT_NAME from doctors  
where DOCTORS_ID=202 or DOCTORS_ID= 205
```

Create view doctors_bio as

$$\Pi_{\text{doctors_name, qualifications, DEPARTMENT_NAME}} (\sigma_{\text{DOCTORS_ID=202 or DOCTORS_ID= 205}} (\text{doctors}))$$

19) Create a view called patients_bio based on the patients_name, patients_age and sex where dept_id are 102, 103 and 100.

```
create view patients_bio as select patients_name ,patients_age , sex
from patients
where DEPT_ID=102 or DEPT_ID= 103 or DEPT_ID= 100
```

Create view patients_bio as

$\Pi_{patients_name, patients_age, sex} (\sigma_{DEPT_ID=102 \text{ or } DEPT_ID=103 \text{ or } DEPT_ID=100} (doctors))$

Group By:

20) Display doctors_id in the doctors table group by doctors_id.

```
select DOCTORS_ID from DOCTORS_INFO group by DOCTORS_ID
```

$\sigma_{DOCTORS_ID} \gamma_{DOCTORS_ID} (doctors_info)$
